PHOTOTHERAPY UNIT (LED)

ELK-PT30

SINGLE & DOUBLE SURFACE PHOTOTHERAPY UNIT (LED) WITH TROLLY

In the new born period i.e. birth to one month, jaundice can pose a serious problem, because high level of the bilirubin, which is not water soluble, can be decomposed to a harmless metabolic which is water soluble, does not cross blood brain barrier and is rapidly excreted in the bile and urine and so does not accumulate This has been achieved by exposing the infant to bright light (approximately 4.5 micro watts/sq cm/nm) in the range of 420-480 nm wave length by use of conventional phototherapy unit has been one of BJS most important focus in the field of neonatology for many years. In order to remove the limitation of fluorescent and CFL tubes, BJS has utilized long lasting, durable, more efficient and cost effective LEDs with more than double the flux as against what is radiated from conventional, fluorescent and CFL, for jaundice treatment.
